Lab Experiment - 3

Aim

To write a Python program to perform morphological analysis using the NLTK (Natural Language Toolkit) library.

Algorithm

1. Start the program.
2. Import the NLTK library.
3. Download the required WordNet data.
4. Define a list of words.
5. Use `WordNetLemmatizer()` to find the root form of each word.
6. Display the original words and their root forms.
7. Stop the program.

Code :

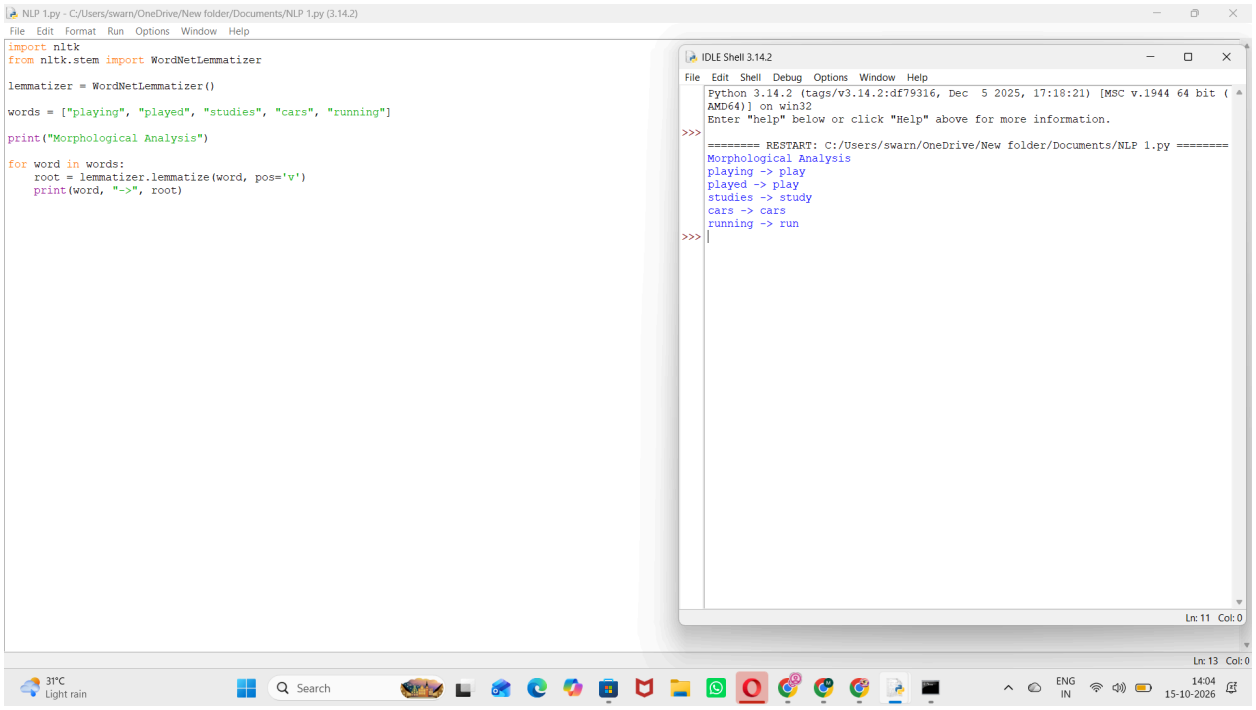

```
import nltk
nltk.download('wordnet')

from nltk.stem import WordNetLemmatizer

lemmatizer = WordNetLemmatizer()

words = ["playing", "played", "studies", "cars", "running"]

for word in words:
    root = lemmatizer.lemmatize(word)
    print(word, "->", root)
```

Result: Thus, morphological analysis was performed successfully using NLTK.
