Lab Experiment-17

Aim

To write a Python program using the NLTK library to access WordNet, retrieve synsets, and explore the meanings of words, including their definitions and examples.

Algorithm

1. Import the NLTK library.
2. Download the WordNet dataset.
3. Get a word as input from the user.
4. Retrieve the synsets of the given word using `wordnet.synsets()`.
5. Display the meanings and definitions of the word.
6. Display example sentences for each meaning.
7. Display the synonyms of the given word.

Python Code

```
import nltk

from nltk.corpus import wordnet

nltk.download('wordnet')

word = input("Enter a word: ")

synsets = wordnet.synsets(word)

print("\nSynsets and Meanings:")

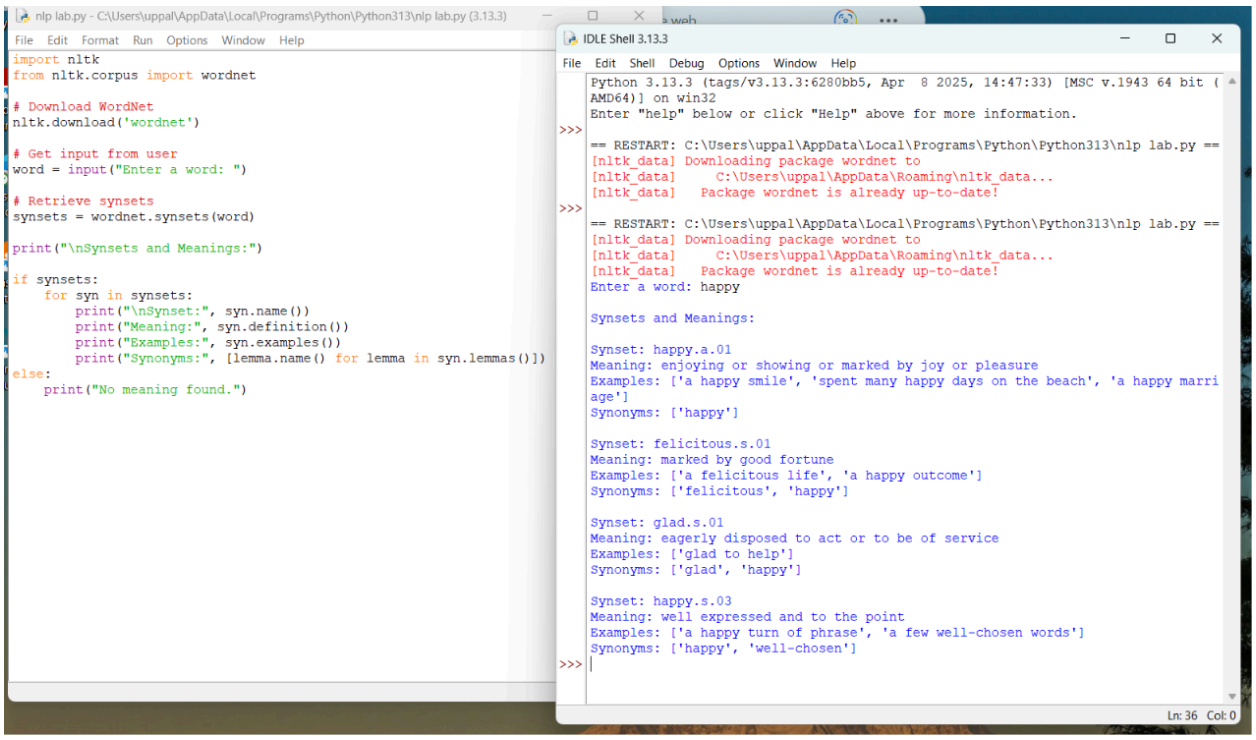

if synsets:

    for syn in synsets:

        print("\nSynset:", syn.name())
```

```
        print("Meaning:", syn.definition())
        print("Examples:", syn.examples())
        print("Synonyms:", [lemma.name() for lemma in syn.lemmas()])
else:
    print("No meaning found.")
```

Output:

Result

Thus, the Python program successfully accesses WordNet and retrieves synsets, meanings, examples, and synonyms for the given word.
