Lab Experiment-22

Aim

To write a Python program to perform reference resolution by identifying pronouns and finding the nouns to which they refer.

Algorithm

1. Import the spaCy library.
2. Load the English language model.
3. Get a paragraph from the user.
4. Process the text using spaCy.
5. Identify pronouns in the text.
6. Find the nearest suitable noun before each pronoun.
7. Display the pronouns and their possible references.

Code

```
import spacy

nlp = spacy.load("en_core_web_sm")
text = input("Enter a paragraph: ")

doc = nlp(text)

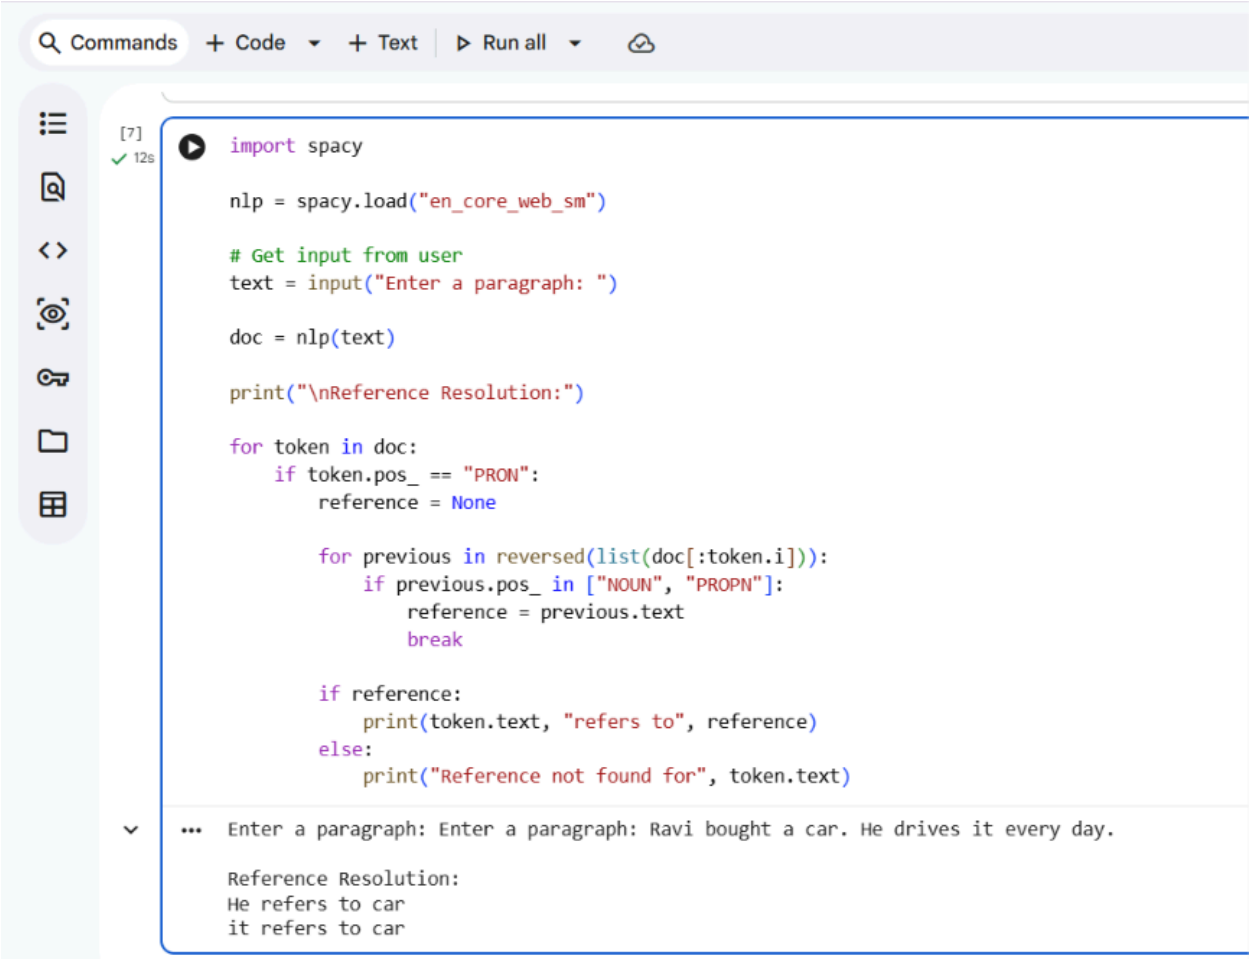

print("\nReference Resolution:")

for token in doc:
    if token.pos_ == "PRON":
        reference = None
```

```
    for previous in reversed(list(doc[:token.i])):
        if previous.pos_ in ["NOUN", "PROPN"]:
            reference = previous.text
            break

    if reference:
        print(token.text, "refers to", reference)
    else:
        print("Reference not found for", token.text)
```

Output:

Result:

Thus, the program demonstrates basic pronoun reference identification in a given text.
