Lab Experiment-24

Aim

To write a Python program to recognize dialog acts such as greetings, questions, requests, and statements in a conversation.

Algorithm

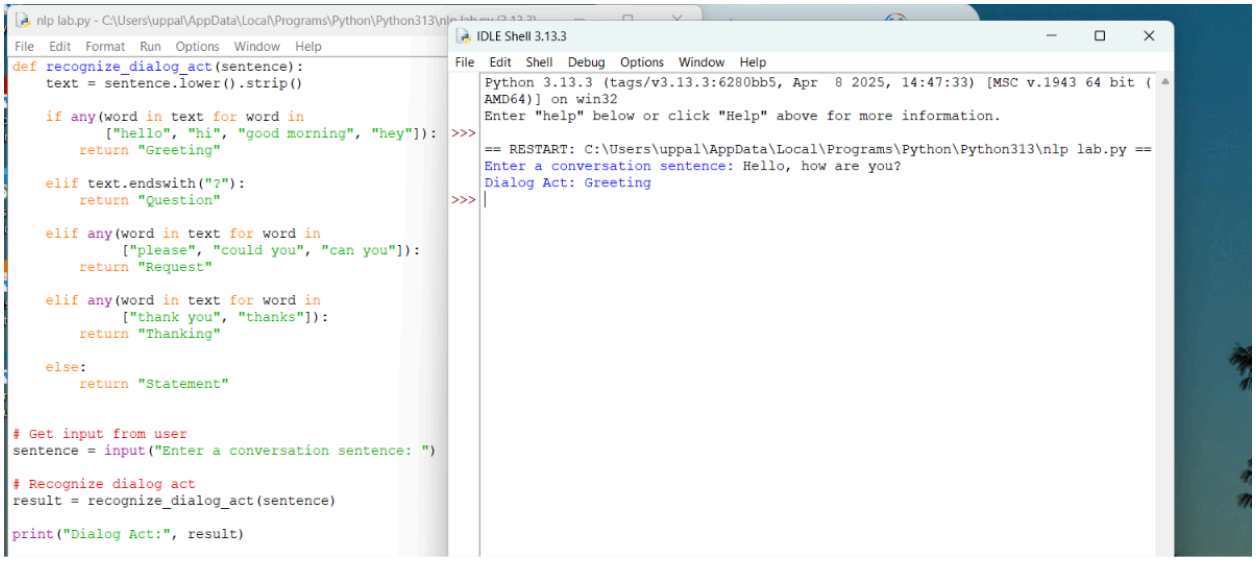

1. Get a sentence from the user.
2. Convert the sentence into lowercase.
3. Check for greeting words.
4. Identify questions using question marks and keywords.
5. Identify requests using keywords such as "please" and "could you".
6. Classify the remaining sentences as statements.
7. Display the dialog act.

Python Code

```
def recognize_dialog_act(sentence):
    text = sentence.lower().strip()
    if any(word in text for word in
           ["hello", "hi", "good morning", "hey"]):
        return "Greeting"
    elif text.endswith("?"):
        return "Question"
    elif any(word in text for word in
```

```
        ["please", "could you", "can you"]):
        return "Request"
    elif any(word in text for word in
        ["thank you", "thanks"]):
        return "Thanking"
    else:
        return "Statement"
sentence = input("Enter a conversation sentence: ")
result = recognize_dialog_act(sentence)
print("Dialog Act:", result)
```

Output:

Result

Thus, the program successfully recognizes basic dialog acts in a conversation.
